

fundamentals of heat and mass transfer Manual

Fundamentals of heat and mass transfer are essential concepts in engineering and physical sciences that describe how heat and mass move within materials and across boundaries. Understanding these fundamentals is crucial for designing efficient thermal systems, chemical reactors, and environmental processes. This article provides a comprehensive overview of the core principles, mechanisms, and applications of heat and mass transfer.

Introduction to Heat and Mass Transfer

Heat and mass transfer are interconnected processes that govern the transfer of energy and matter in various systems. Although they involve different physical quantities—thermal energy and mass—they often occur simultaneously in practical applications, influencing the behavior and efficiency of engineering systems.

Fundamentals of Heat Transfer

Heat transfer involves the movement of thermal energy from a region of higher temperature to one of lower temperature. It occurs through three primary mechanisms: conduction, convection, and radiation.

Conduction

Conduction is the transfer of heat through a solid material without any movement of the material itself. It occurs due to molecular collisions and vibrations.

- **Fourier's Law of Heat Conduction:** The basic law governing conduction, expressed as:

$$\mathbf{q} = -k \nabla T$$

where:

- $\mathbf{q}$ = heat flux vector (W/m^2)
- k = thermal conductivity of the material ($\text{W/m}\cdot\text{K}$)
- ∇T = temperature gradient

- The negative sign indicates heat flows from high to low temperature.
- Thermal conductivity varies with material; metals typically have high k , insulators have low k .

Convection

Convection involves heat transfer between a solid surface and a moving fluid (liquid or gas). It combines conduction within the fluid and the bulk movement of the fluid itself.

- **Natural convection:** Driven by buoyancy forces due to density differences caused by temperature variations.

- **Forced convection:** Induced by external forces such as fans or pumps.

- **Newton's Law of Cooling:** The heat transfer rate per unit area is proportional to the temperature difference:

$$q = h (T_s - T_\infty)$$

where:

- h = convective heat transfer coefficient ($\text{W}/\text{m}^2\cdot\text{K}$)
- T_s = surface temperature
- T_∞ = fluid temperature far from the surface

Radiation

Radiative heat transfer occurs through electromagnetic waves and can occur across a vacuum.

- **Stefan-Boltzmann Law:** Total radiative heat energy emitted per unit area:

$$E = \sigma T^4$$

where:

- E = emissive power (W/m^2)
- σ = Stefan-Boltzmann constant ($\sim 5.67 \times 10^{-8} \text{ W}/\text{m}^2\cdot\text{K}^4$)
- T = absolute temperature (K)

- Objects emit and absorb radiation depending on their temperature and surface properties.

Fundamentals of Mass Transfer

Mass transfer involves the movement of molecules from one location to another, driven by concentration gradients. It is fundamental in processes such as diffusion, filtration, and chemical reactions.

Diffusion

Diffusion is the process by which molecules spread from regions of higher concentration to lower concentration, driven by concentration gradients.

- **Fick's First Law:** Describes steady-state diffusion flux:

$$J = -D \frac{dC}{dx}$$

where:

- J = diffusion flux ($\text{mol/m}^2\cdot\text{s}$)
- D = diffusion coefficient (m^2/s)
- C = concentration (mol/m^3)

- The flux is proportional to the concentration gradient, with the negative sign indicating flow from high to low concentration.

Convective Mass Transfer

Similar to heat convection, mass transfer can be enhanced by fluid flow over surfaces or within systems.

- **Mass transfer coefficient (k_m):** Defines the rate of mass transfer analogous to the heat transfer coefficient.
- The overall mass transfer rate depends on the concentration difference and the mass transfer characteristics of the system.

Dimensionless Numbers in Heat and Mass Transfer

Dimensionless numbers help analyze, model, and scale heat and mass transfer processes.

Key Dimensionless Numbers

- **Nusselt Number (Nu):** Ratio of convective to conductive heat transfer:

$$Nu = hL / k$$

where:

- L = characteristic length
- Higher Nu indicates more effective convection.

- **Prandtl Number (Pr):** Ratio of momentum diffusivity to thermal diffusivity:

$$Pr = \nu / \alpha$$

where:

- ν = kinematic viscosity
- α = thermal diffusivity
- Helps determine the relative thickness of velocity and thermal boundary layers.

- **Schmidt Number (Sc):** Ratio of momentum diffusivity to mass diffusivity:

$$Sc = \nu / D$$

where:

- D = mass diffusivity

Introduction to Heat and Mass Transfer

Heat and mass transfer are two interconnected phenomena that describe the movement of thermal energy and chemical species, respectively, within and between physical systems. While they operate on different principles, their study often overlaps, especially in processes like evaporation, condensation, and chemical reactions.

Heat transfer primarily concerns the transfer of thermal energy due to temperature differences, occurring via conduction, convection, and radiation. Conversely, mass transfer involves the movement of species or particles driven by concentration gradients, occurring via diffusion and convection.
