Solving Schrödinger Equation with Mathcad

The Schrödinger equation is fundamental in quantum mechanics, describing how the quantum state of a physical system evolves over space and time. Its solutions provide critical insights into the behavior of particles at microscopic scales, including their energy levels, probability distributions, and wavefunctions. However, solving the Schrödinger equation analytically is often complex or impossible for systems with intricate potentials or boundary conditions. This is where computational tools like Mathcad come into play, offering a powerful platform for numerically approximating solutions to quantum problems. In this article, we explore how to leverage Mathcad's capabilities to solve the Schrödinger equation, from setting up the problem to interpreting the results.

Understanding the Schrödinger Equation

Time-Dependent vs. Time-Independent Schrödinger Equation

The Schrödinger equation exists in two primary forms:

- Time-Dependent Schrödinger Equation (TDSE):

$$i \hbar \frac{\partial}{\partial t} \Psi(x,t) = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} \Psi(x,t) + V(x) \Psi(x,t)$$

It describes the evolution of a quantum state over time.

- Time-Independent Schrödinger Equation (TISE):

$$-\frac{\hbar^2}{2m} \frac{d^2}{dx^2} \psi(x) + V(x) \psi(x) = E \psi(x)$$

\]

It is used to find stationary states and their energies, often the primary focus when solving quantum systems for bound states.

In most practical scenarios, especially for stationary solutions, the TISE is the equation of interest.

Mathematical Formulation for Numerical Solution

The time-independent form can be written as an eigenvalue problem:

\[

$$\hat{H} \psi(x) = E \psi(x)$$

\]

where $\hat{H}$ is the Hamiltonian operator. Numerically, solving this involves discretizing the spatial domain and approximating derivatives using finite differences or other methods.

Preparing to Solve Schrödinger Equation in Mathcad

Setting Up the Spatial Domain

Before solving, define the spatial interval where the wavefunction is significant, typically from $x_{\min}$ to $x_{\max}$. For example:

- Choose $x_{\min} = -10$, $x_{\max} = 10$.
- Select a number of grid points, say $(N = 1000)$, for sufficient resolution.

This discretization transforms the continuous differential equation into a matrix eigenvalue problem.

Defining the Potential Function $V(x)$

The potential function characterizes the physical system. Examples include:

- Infinite potential well: $V(x) = 0$ inside the well, infinite outside.
- Harmonic oscillator: $V(x) = \frac{1}{2} m \omega^2 x^2$.
- Finite potential well or barriers.

In Mathcad, define $V(x)$ as a function or array corresponding to your discretized points.

Discretizing the Schrödinger Equation

Applying finite difference approximation to the second derivative:

$$\frac{d^2 \psi}{dx^2} \approx \frac{\psi_{i+1} - 2\psi_i + \psi_{i-1}}{\Delta x^2}$$

This converts the differential equation into a matrix eigenvalue problem:

$$\mathbf{H} \Psi = E \Psi$$

where $\mathbf{H}$ is a tridiagonal matrix representing the Hamiltonian.

Implementing the Solution in Mathcad

Constructing the Hamiltonian Matrix

Steps to build the Hamiltonian matrix:

- Create the grid points:

```
```mathcad
```

```
x_{min} := -10
```

```
x_{max} := 10
```

```
N := 1000
```

```
?x := (x_{max} - x_{min}) / (N - 1)
```

$x := x_{\min} + (0..N-1) \cdot \Delta x$

```

- Define the potential $V(x)$:

```mathcad

$V := (x) \cdot 0$  // For free particle or modify for specific potentials

$V_{\text{array}} := V(x)$

```

- Construct the kinetic energy matrix (T) using finite differences:

```mathcad

$T := \text{diag}(2, N) - \text{diag}(1, N-1, 1) + \text{diag}(1, 1, N-1)$

$T := (\hbar^2) / (2m \cdot \Delta x^2) \cdot T$

```

- Construct the potential energy matrix (V) :

```mathcad

$V_{\text{matrix}} := \text{diag}(V_{\text{array}})$

```

- Total Hamiltonian matrix:

```mathcad

$H := T + V_{\text{matrix}}$

...

Note: In Mathcad, matrix operations are straightforward, but care must be taken to ensure correct dimensions and boundary conditions (e.g., wavefunction zero at boundaries).

## Solving the Eigenvalue Problem

Mathcad offers functions like ``eigenvalues`` and ``eigenvectors`` to solve the matrix eigenproblem:

```
```mathcad
```

```
E_vals, ? := eigen(H)
```

...

- E_vals: Array of eigenvalues corresponding to energy levels.
- ?: Matrix where each column is an eigenfunction.

Select the lowest eigenvalues and their eigenfunctions to analyze bound states.

Visualizing and Analyzing Results

Plotting Eigenfunctions and Probability Densities

Plot the eigenfunctions:

```
```mathcad
```

```
plot(x, ?(:,1))
```

```
xlabel("x")
```

```
ylabel("? (x)")
```

```
title("Ground State Wavefunction")
```

...

Probability density:

```
```mathcad
```

```
prob_density := abs(ψ(x))^2
```

```
plot(x, prob_density)
```

```
xlabel("x")
```

```
ylabel("|ψ(x)|^2")
```

```
title("Probability Density of Ground State")
```

```
```
```

## Solving Schrödinger Equation with Mathcad: An In-Depth Investigation

The Schrödinger equation stands as a cornerstone of quantum mechanics, describing how quantum states evolve and how particles behave at atomic and subatomic scales. Its solutions provide critical insights into phenomena such as atomic orbitals, quantum tunneling, and energy quantization. However, solving the Schrödinger equation analytically is often feasible only for simple systems like the infinite potential well or the harmonic oscillator. For more complex potentials, numerical methods become essential, prompting researchers and students alike to seek reliable computational tools.

Mathcad, a widely used engineering math software, offers a versatile platform for solving differential equations numerically, including the Schrödinger equation. This article explores the methodologies, challenges, and best practices associated with solving the Schrödinger equation using Mathcad, providing a comprehensive guide suitable for researchers, educators, and students engaged in quantum mechanics.

## Understanding the Schrödinger Equation

### The Time-Dependent and Time-Independent Forms

The non-relativistic Schrödinger equation in one dimension is generally expressed as:

$$\left[ i\hbar \frac{\partial}{\partial t} \Psi(x, t) = -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial x^2} \Psi(x, t) + V(x) \Psi(x, t) \right]$$

- Time-Dependent Schrödinger Equation (TDSE): Describes how the wavefunction  $\Psi(x, t)$  evolves over time.

- Time-Independent Schrödinger Equation (TISE): Used when the potential  $V(x)$  is stationary, leading to solutions of the form:

$$\left[ -\frac{\hbar^2}{2m} \frac{d^2}{dx^2} \psi(x) + V(x) \psi(x) = E \psi(x) \right]$$

where  $E$  is the energy eigenvalue and  $\psi(x)$  the spatial part of the wavefunction.

This review focuses mainly on the time-independent form, as it is most amenable to numerical approaches and critical for understanding stationary states.

### Challenges in Numerical Solution

Solving the Schrödinger equation numerically involves several challenges:

- Handling boundary conditions, especially for bound states.
- Ensuring numerical stability over the chosen spatial domain.
- Correctly discretizing the differential operators.
- Accurately determining eigenvalues and eigenfunctions.
- Managing potential singularities or discontinuities in  $V(x)$ .

Mathcad's flexible computational environment provides tools to address these challenges effectively.

### Approaches to Solving Schrödinger Equation with Mathcad

#### Discretization Techniques

The core of numerical solutions involves discretizing the continuous differential equation into a matrix eigenvalue problem. Common methods include:

- Finite Difference Method (FDM): Approximates derivatives via difference equations.
- Matrix Methods (e.g., Variational or Shooting Methods): Convert the problem into matrix eigenvalue problems.

Mathcad's symbolic and numerical capabilities facilitate implementing these techniques efficiently.

#### Finite Difference Method (FDM) in Mathcad

##### Step-by-Step Procedure:

- Define the spatial domain: Choose a sufficiently large interval  $[x_{\min}, x_{\max}]$  to contain the physical system.

- Discretize the domain: Divide into  $(N)$  equally spaced points:

$$x_i = x_{\min} + i \Delta x, \quad i=0,1,\dots,N$$

where  $\Delta x = (x_{\max} - x_{\min})/N$ .

- Set up the Hamiltonian matrix: Using central difference approximations for the second derivative:

$$\frac{d^2}{dx^2} \psi(x_i) \approx \frac{\psi_{i-1} - 2\psi_i + \psi_{i+1}}{\Delta x^2}$$

The Hamiltonian matrix  $(H)$  becomes tridiagonal, with elements:

$$H_{i,i} = \frac{\hbar^2}{2m \Delta x^2} + V(x_i), \quad H_{i,i+1} = H_{i+1,i} = -\frac{\hbar^2}{2m \Delta x^2}$$

- Solve the eigenvalue problem:

$$H \vec{\psi} = E \vec{\psi}$$

Using Mathcad's `Eigenvalues` and `Eigenvectors` functions to compute the energy levels and corresponding wavefunctions.

- Apply boundary conditions: Typically, wavefunctions vanish at the domain boundaries.

- Normalize the eigenfunctions: Ensure the wavefunctions satisfy:

$$\int$$

$$\int |\psi(x)|^2 dx = 1$$

$$\int$$

Using numerical integration such as the trapezoidal rule.

## Practical Implementation in Mathcad

### Setting Up the Code

A typical Mathcad worksheet for solving the Schrödinger equation with FDM involves the following components:

- Parameter Definitions: Physical constants, potential function  $V(x)$ , domain limits, number of points  $N$ .
- Discretization: Generating the array of  $x_i$ .
- Hamiltonian Matrix Construction: Filling the matrix with the appropriate diagonal and off-diagonal elements.
- Eigenproblem Solution: Using Mathcad's `Eigenvalues` and `Eigenvectors`.
- Wavefunction Extraction: Selecting the eigenvector corresponding to a particular eigenvalue.
- Normalization and Visualization: Plotting the eigenfunction and verifying normalization.

### Example: Infinite Square Well

Suppose we want to solve for the energy levels of a particle in an infinite potential well of width  $a$ .

- Potential:

\[

$V(x) = \begin{cases}$

0 & 0

$\infty$  & \text{elsewhere}

$\end{cases}$

\]

- Boundary conditions:  $\psi(0) = \psi(a) = 0$ .

Mathcad code snippets:

``plaintext

$x_{\min} := 0$

$x_{\max} := a$

$N := 1000$

$\Delta x := (x_{\max} - x_{\min})/N$

$x := x_{\min} + (0..N) \Delta x$

$V := (x > 0) \text{ AND } (x$

$H := \text{matrix}(N-1, N-1)$

for i in 1..N-1 do

for j in 1..N-1 do

if i == j then

$H[i,j] := 2 \Delta x + V[i]$

else if  $\text{abs}(i - j) == 1$  then

$H[i,j] := -t$

else

$H[i,j] := 0$

end

end

end

where  $t := (\hbar^2) / (2 m a^2)$

...

Then, compute eigenvalues and eigenvectors:

```plaintext

$E_vals, E_vecs := \text{eig}(H)$

...

Select the lowest eigenvalues and plot the corresponding eigenfunctions.

Interpreting Results and Validating Solutions

Eigenvalues and Eigenfunctions

- The computed eigenvalues approximate the allowed energy levels.
- Eigenfunctions should be normalized and exhibit expected symmetry properties?e.g., sinusoidal for an infinite well.

Accuracy and Convergence

- Increase N to improve spatial resolution.

- Verify that eigenvalues stabilize with finer discretization.
- Cross-check results with analytical solutions where available.

Limitations and Improvements

- Computational Load: Large matrices require significant computational resources.
- Potential Complexity: Discontinuous or non-analytic potentials may necessitate specialized discretization schemes.
- Higher Dimensions: Extending to 2D or 3D requires tensor product grids and more advanced algorithms.

Advanced Topics: Beyond Basic Finite Differences

- Spectral Methods: Utilizing basis functions for higher accuracy.
- Shooting Method: Iteratively adjusting energy guesses to satisfy boundary conditions.
- Finite Element Method (FEM): For complex geometries.

Mathcad can support these approaches with custom programming and integration capabilities.

Conclusion and Future Directions

Solving the Schrödinger equation with Mathcad offers a practical and educational pathway to understanding quantum systems numerically. Its user-friendly interface, combined with matrix operations and plotting tools, makes it suitable for both instructional purposes and preliminary research.

While finite difference methods provide a straightforward entry point, more sophisticated techniques can enhance accuracy and handle complex potentials. As computational power continues to grow, integrating Mathcad with other numerical libraries or software (e.g., MATLAB, Python) could further expand its capabilities.

Key takeaways:

- Mathcad simplifies the implementation of discretization schemes for quantum problems.
- Proper handling of boundary conditions and normalization is essential.
- Validation against analytical solutions ensures reliability.
- The approach scales to more complicated potentials, multi-dimensional problems, and time-dependent scenarios with appropriate modifications.

Ultimately, mastering the numerical solution of the Schrödinger equation with Mathcad empowers researchers and students to explore quantum phenomena beyond the reach of analytical methods, fostering deeper understanding and innovation in quantum mechanics.
