2. Particle Size and Scope of Homogeneity

- Particles of solute are extremely small (less than 1 nanometer in size).
- They do not settle upon standing, unlike suspensions.

3. Transparency

Most solutions are transparent and do not scatter light, although some (like colloidal solutions) may appear cloudy.

4. Diffusion

The process of solute particles spreading evenly throughout the solvent, driven by concentration differences.

5. Tyndall Effect

Solutions do not exhibit the Tyndall effect (scattering of light), while colloids do.

- The solute is added gradually to the solvent with constant stirring until it dissolves.

2. Heating Method

- Used when the solute dissolves more readily at higher temperatures (e.g., sugar in water).
- The solution is gently heated while stirring to increase solubility.

3. Crystallization Method

- For preparing saturated solutions; excess solute is dissolved, then the solution is cooled to crystallize out excess solute.

4. Using a Solvent in Excess

- Ensures complete dissolution of solute, especially when working with small quantities.

5. Dilution

- To prepare a less concentrated solution, a known volume of a concentrated solution is mixed with solvent.

Understanding Concentration: Quantitative Aspects of Solutions

Concentration indicates how much solute is present in a given quantity of solution. It is a crucial concept for precise chemical work.

Common Units of Concentration:

- Mass by volume percentage (% w/v): grams of solute per 100 mL of solution

Common Questions and Their Answer Keys

Below are sample questions frequently encountered regarding solutions and mixtures, along with their detailed answer keys.

Question 1: What is the difference between a solution and a suspension?

Answer: A solution is a homogeneous mixture where the solute particles are uniformly dispersed at the molecular or ionic level, making it transparent and stable over time. In contrast, a suspension is a heterogeneous mixture with larger particles that do not stay suspended indefinitely; these particles can settle out over time. Examples include saltwater (solution) and muddy water (suspension).

Question 2: How do you prepare a 0.5 M NaCl solution from stock NaCl solution of 5 M concentration?

Answer: Use the dilution formula: $M_1V_1 = M_2V_2$.

- Where:
- M_1 = initial concentration = 5 M
- M_2 = desired concentration = 0.5 M
- V_2 = final volume (say, 1 L or 1000 mL)

Calculate V_1 :

$$- V_1 = (M_2 \times V_2) / M_1 = (0.5 \text{ M} \times 1000 \text{ mL}) / 5 \text{ M} = 100 \text{ mL}$$

Therefore, dilute 100 mL of 5 M NaCl solution with distilled water to make 1 L of 0.5 M NaCl solution.

Question 3: What is the solubility of potassium nitrate (KNO₃) at 25°C?

Answer: The solubility of KNO₃ at 25°C is approximately 32 grams per 100 mL of water. This means that at this temperature, 32 g of KNO₃ can dissolve in 100 mL of water to form a saturated

solution.

Question 4: Describe the process of distillation and its application in separating mixtures.

Answer: Distillation involves heating a liquid mixture to its boiling point, vaporizing the component with the lower boiling point, and then condensing the vapor back into liquid form. This process effectively separates components based on differences in boiling points. Applications include purifying water, separating ethanol from fermentation mixtures, and refining crude oil.

Question 5: Calculate the percent by mass of sugar in a solution made by dissolving 20 grams of sugar in 80 grams of water.

Answer: Percent by mass = (mass of solute / total mass of solution) × 100.

- Mass of sugar (solute) = 20 g
- Mass of water (solvent) = 80 g
- Total mass of solution = 20 g + 80 g = 100 g

Percent by mass = (20 g / 100 g) × 100 = 20%

Nelson chemistry 12 unit 2 review solutions

Nelson Chemistry 12 Unit 2 Review Solutions

Nelson Chemistry 12 Unit 2 Review Solutions offers a comprehensive exploration of solutions, their properties, and their behaviors in various chemical contexts. This unit is fundamental for understanding how substances interact in aqueous and non-aqueous environments, forming the basis for many real-world applications, including industrial processes, environmental science, and biological systems. A thorough review of this unit equips students with the knowledge necessary to grasp concepts such as solution formation, concentration calculations, solubility, and the factors influencing solubility and reaction rates.

Understanding Solutions: Definitions and Classifications

What is a Solution?

A solution is a homogeneous mixture composed of two or more substances. In a solution, one substance (the solute) is uniformly dispersed within another (the solvent). The particles of the solute are at the molecular or ionic level, making the mixture uniform throughout.

Types of Solutions

- **Aqueous solutions:** Solutions where water is the solvent. Examples include saltwater and sugar solutions.
- **Non-aqueous solutions:** Solutions where solvents other than water are used, such as alcohol or benzene solutions.

Based on the state of solutes and solvents, solutions can be classified as:

- Solid in solid (e.g., alloys like bronze)
- Solid in liquid (e.g., salt in water)
- Liquid in liquid (e.g., alcohol in water)
- Gas in gas (e.g., air)
- Gas in liquid (e.g., carbonated beverages)
- Liquid in solid (e.g., mercury in dental amalgams)

Factors Affecting Solution Formation and Solubility

Nature of Solute and Solvent

The principle "like dissolves like" guides the solubility behavior. Polar solvents tend to dissolve polar or ionic solutes, while non-polar solvents dissolve non-polar solutes.

Temperature

Temperature significantly impacts solubility. For most solids, solubility increases with temperature. However, for gases, solubility typically decreases as temperature rises.

Pressure

Pressure affects the solubility of gases. According to Henry's Law, increasing pressure increases the solubility of a gas in a liquid.

Agitation

Stirring or shaking can increase the rate at which a solution forms by dispersing solute particles throughout the solvent.

Concentration Units and Calculations

Common Units of Concentration

- **Molarity (M):** Moles of solute per liter of solution.
- **Molality (m):** Moles of solute per kilogram of solvent.
- **Mass percent (%):** Mass of solute divided by total mass of solution, multiplied by 100.
- **Volume percent (% v/v):** Volume of solute per volume of solution, multiplied by 100.
- **Mole fraction (X):** Ratio of moles of a component to total moles of all components.

Calculations of Molarity and Dilutions

To determine molarity, use the formula:

$$M = \text{mol of solute} / \text{liters of solution}$$

For dilutions, the relation is:

$$C_1V_1 = C_2V_2$$

where C_1 and V_1 are the concentration and volume of the stock solution, and C_2 and V_2 are those of the diluted solution.

Steps for preparing a dilute solution:

- Calculate the moles of solute needed.
- Determine the volume of stock solution required.
- Mix with the appropriate amount of solvent to achieve desired concentration.

Solubility and Factors Influencing It

Understanding Solubility

Solubility refers to the maximum amount of solute that can dissolve in a solvent at a specific temperature, forming a saturated solution. It is commonly expressed in grams per 100 mL of solvent or as a molar value.

Solubility Curves

Graphs plotting solubility against temperature provide visual representations of how much solute can dissolve at different temperatures. These curves help predict whether a solution is saturated, unsaturated, or supersaturated under specific conditions.

Influencing Factors

- **Temperature:** As mentioned, generally increases solubility for solids.
- **Nature of solute and solvent:** Similar polarity and intermolecular forces enhance solubility.
- **Pressure:** Mainly affects gases; higher pressure increases gas solubility.
- **Presence of other solutes:** Can either increase or decrease solubility due to common ion effects or interactions.

Colloids and Suspensions: Special Types of Solutions

Colloids

Colloids are mixtures where particles are intermediate in size (1-1000 nm) and remain dispersed without settling. Examples include milk, fog, and gelatin.

- Properties include tyndall effect (scattering of light), stability, and inability to be separated by ordinary filtration.

Suspensions

Suspensions contain larger particles (>1000 nm) that tend to settle over time. Examples include muddy water and flour in water.

- Require filtration or centrifugation for separation.

Solutions and Reaction Rates

Effect of Concentration on Reaction Rate

Higher concentrations of reactants generally increase the frequency of collisions, leading to faster reaction rates.

Factors Affecting Reaction Rates in Solutions

- **Concentration:** More solute increases collision probability.
- **Temperature:** Elevated temperatures increase kinetic energy and collision energy.
- **Catalysts:** Lower activation energy, speeding up reactions.
- **Surface area:** Finely divided particles provide more contact points.

Applications of Solutions in Real Life

Industrial Applications

- Manufacturing of pharmaceuticals and chemicals.
- Water treatment processes involving coagulation, flocculation, and filtration.
- Food industry, such as flavoring and preservatives.

Environmental and Biological Significance

- Understanding ocean salinity and freshwater systems.
- Transport of nutrients and gases in biological systems.

Summary and Key Takeaways

- Solutions are homogeneous mixtures with properties dictated by the nature of solutes and solvents.
- Temperature, pressure, and the nature of substances influence solubility.
- Concentration calculations are fundamental for preparing solutions and performing titrations.
- Special solutions like colloids and suspensions have unique properties relevant in various scientific fields.

- Types of chemical bonds (ionic, covalent, metallic)
- Lewis structures and molecular geometry
- VSEPR theory and molecular shapes
- Polarity and intermolecular forces
- Bonding theories (Valence Bond Theory, Molecular Orbital Theory)
- Properties of molecular compounds

Fundamental Concepts and Their Solutions

1. Types of Chemical Bonding

Ionic Bonding:

- Formed between metals and non-metals.
- Electrons transfer from one atom to another, leading to the formation of ions.
- The electrostatic attraction between oppositely charged ions results in ionic bonds.

Solution Approach:

- Recognize the element types involved to predict bonding type.
- Use electronegativity differences:
 - > 1.7 indicates ionic bonding
 - $0.3-1.7$ suggests polar covalent bonds
 -

Covalent Bonding:

- Occurs between non-metals sharing electron pairs.
- Can be single, double, or triple bonds based on the number of shared pairs.

Metallic Bonding:

- Metal atoms share a "sea" of delocalized electrons.
- Responsible for properties like electrical conductivity and malleability.

Solution Tips:

- Be able to classify compounds based on their constituent elements.
- Use electronegativity values to determine bond type.

2. Lewis Structures and Electron Distribution

Approach to Drawing Lewis Structures:

- Count total valence electrons.
- Arrange atoms with the central atom typically being the least electronegative.

- Distribute electrons to satisfy the octet rule (or duet for hydrogen).
- Use double or triple bonds if necessary to fulfill octets.

Common Pitfalls:

- Forgetting to account for formal charges.
- Overlooking expanded octets in elements beyond period 2.

Solution Strategies:

- Check the octet rule after initial drawing.
- Minimize formal charges to find the most stable structure.

3. Molecular Geometry and VSEPR Theory

Basic Steps:

- Determine the central atom and count bonding and lone pairs.
- Use VSEPR (Valence Shell Electron Pair Repulsion) theory to predict shape.
- Classify geometry: linear, trigonal planar, tetrahedral, trigonal bipyramidal, octahedral, etc.

Examples:

- A molecule with 2 bonding pairs and 0 lone pairs: linear.
- 4 bonding pairs and 1 lone pair: see-saw shape.

Key Considerations:

- Lone pairs influence bond angles.
- The repulsion strength of lone pairs is greater than bonding pairs, affecting geometry.

4. Polarity and Intermolecular Forces

Polarity:

- Depends on the difference in electronegativities and the shape of the molecule.
- Symmetrical molecules with polar bonds may be nonpolar overall.

Intermolecular Forces:

- Dipole-dipole: Between polar molecules.
- Hydrogen bonding: Special dipole-dipole interaction involving H and N, O, or F.
- London dispersion forces: Present in all molecules; strongest in larger, more polarizable molecules.

Impact on Properties:

- Higher intermolecular forces lead to higher boiling points and solubility in polar solvents.

Advanced Bonding Theories and Concepts

1. Valence Bond Theory (VBT)

- Explains covalent bonding via overlapping atomic orbitals.
- Bond strength relates to the degree of orbital overlap.
- Hybridization (sp, sp², sp³, etc.) explains molecular geometries.

Solution Tips:

- Identify hybridization based on the number of electron groups around the central atom.
- Use hybrid orbitals to predict molecular shape and bond angles.

2. Molecular Orbital (MO) Theory

- Describes bonding through the combination of atomic orbitals into molecular orbitals.
- Explains magnetic properties and bond order more accurately.

Key Points:

- Bond order is calculated as (number of electrons in bonding MOs - in antibonding MOs)/2.

- Diamagnetic molecules have all electrons paired; paramagnetic molecules have unpaired electrons.

Practical Applications and Problem-Solving Techniques

Sample Problem 1:

Determine the shape and polarity of SO_2 .

Solution:

- Count valence electrons: S (6), O ($6 \times 2 = 12$), total 18.
- Lewis structure: S in the center with two double bonds to O atoms, with lone pairs on S.
- Electron geometry: trigonal planar.
- Molecular shape: bent (due to lone pairs).
- Polarity: The molecule is bent with different dipole moments; overall polar.

Sample Problem 2:

Predict the bond angle in CH_4 and explain.

Solution:

- Carbon has four bonding pairs and no lone pairs, hybridized sp^3 .
- Shape: tetrahedral.
- Bond angles: approximately 109.5° , minimized repulsion.

Problem-Solving Tips:

Question What are the key concepts covered in Nelson Chemistry 12 Unit 2 review solutions? Unit 2 focuses on chemical reactions, stoichiometry, limiting reactants, and solution chemistry, including concentration calculations and solution properties. How do I determine the limiting reactant in a chemical reaction problem? To find the limiting reactant, compare the molar amounts of each reactant based on the balanced chemical equation, and identify which one runs out first during the reaction. What is the significance of molarity in solution chemistry, and how is it calculated? Molarity measures the concentration of a solution, calculated as moles of solute divided by liters of solution ($M = \text{mol/L}$). It is essential for preparing and diluting solutions accurately. How can I use stoichiometry to predict the amount of product formed in a reaction? Use the balanced

chemical equation to relate reactants and products, convert quantities to moles, and apply mole ratios to calculate the expected amount of product formed. What are common methods for preparing solutions of known concentration? Solutions are prepared by dissolving a known mass of solute in a solvent and diluting to a specific volume, often using techniques like dilution and standard solution preparation. How do I calculate the concentration of a solution after dilution? Use the dilution formula: $C_1V_1 = C_2V_2$, where C and V represent concentration and volume before and after dilution, to find the new concentration. What are typical errors to avoid when solving solution chemistry problems? Common errors include improper unit conversions, neglecting significant figures, using the wrong molar ratios, and misreading the problem's data. How do solubility and temperature affect solution formation and concentration? Solubility often increases with temperature, affecting how much solute can dissolve. Understanding these relationships helps in preparing solutions and predicting their behavior. Where can I find additional practice problems for Nelson Chemistry 12 Unit 2 solutions review? Additional practice can be found in the Nelson Chemistry 12 textbook, online educational resources, and chemistry review websites that offer practice quizzes and exercises.
