Deep Dive into Programming Techniques

Register-Level Programming

At its most fundamental level, programming involves manipulating device registers directly. This approach offers maximum control but requires detailed knowledge of hardware specifications.

Example: Turning on an LED connected to GPIO pin

```
``c

// Enable GPIOA clock

RCC->AHB1ENR |= RCC_AHB1ENR_GPIOAEN;

// Set PA5 as output

GPIOA->MODER |= GPIO_MODER_MODE5_0;

// Turn on LED

GPIOA->ODR |= GPIO_ODR_OD5;

````
```

While instructive, this method is verbose and error-prone for complex applications.

### Hardware Abstraction Libraries

To simplify development, STMicroelectronics provides Hardware Abstraction Layer (HAL) libraries, which encapsulate register manipulations in higher-level APIs.

Example: Using HAL to toggle an LED

```
```c
```

```
HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_SET);
```

```
```
```

HAL libraries promote portability and reduce development time, especially for complex projects.

## Interrupts and Timers

Real-time responsiveness is often achieved through interrupts and timers.

Implementing a Timer Interrupt:

- Configure the timer peripheral.
- Enable the corresponding interrupt.
- Write an interrupt handler to execute at each timer overflow.

```
```c
```

```
void TIM2_IRQHandler(void) {
```

```
    if (TIM2->SR & TIM_SR_UIF) {
```

```
        TIM2->SR &= ~TIM_SR_UIF; // Clear interrupt flag
```

```
        // Toggle LED or perform task
```

```
    }
```

```
}
```

```
```
```

This approach allows for precise, asynchronous control over hardware events.
