The Foundations of Linear Models

What Are Linear Models?

At their core, linear models describe a relationship between a dependent variable (response) and one or more independent variables (predictors) through a linear equation:

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_p x_p + \epsilon$$

where:

- y is the response variable.
- $x_1, x_2, \dots, x_p$ are predictor variables.
- β_0 is the intercept.
- $\beta_1, \beta_2, \dots, \beta_p$ are coefficients representing the effect size of each predictor.
- ϵ is the error term, capturing noise and unmodeled variation.

This overview underscores the critical role of R in modern biostatistics, highlighting its capabilities, applications, and future potential in advancing health sciences.

**Question** What are the key packages used for biostatistics analysis in R? Common packages include 'tidyverse' for data manipulation and visualization, 'survival' for survival analysis, 'lme4' for mixed-effects models, 'ggplot2' for plotting, and 'Bioconductor' for genomic data analysis. **Answer** How can I perform a survival analysis in R? You can use the 'survival' package, employing functions like 'survfit()' to fit Kaplan-Meier curves and 'coxph()' for Cox proportional hazards models. Visualization can be done with 'plot()' or 'ggsurvplot()' from the 'survminer' package. What statistical tests are commonly used in biostatistics with R? Common tests include t-tests ('t.test()'), chi-square tests ('chisq.test()'), ANOVA ('aov()'), and non-parametric tests like Mann-Whitney ('wilcox.test()'). These are available in base R and additional packages. How do I perform logistic regression analysis in R? Use the 'glm()' function with 'family=binomial' to fit logistic regression models. For
