Computation as a Physical Process

In this paradigm, computation is not merely an abstract mathematical operation but a physical process that:

- **Involves Energy and Entropy:** According to Landauer's principle, erasing a bit of information requires a minimum amount of energy, linking computation directly to thermodynamics.
- **Is Subject to Quantum Mechanics:** Quantum states can represent multiple pieces of information simultaneously (superposition), enabling quantum parallelism.
- **Follows Physical Laws:** Computation is constrained by the same physical laws that govern the universe, such as speed limits imposed by the speed of light and thermodynamic principles.

Implications of Computation in Physics

This understanding yields several profound implications:

- **Limits of Computation:** Physical laws impose fundamental bounds on what can be computed, such as the Bekenstein bound relating information content to energy and space.
- **Information as a Resource:** In quantum information theory, entanglement and coherence are resources for performing tasks beyond classical capabilities.
