Understanding the Foundation: FileMaker Pro 6 and XML

What is XML and Why Use It with FileMaker?

XML (Extensible Markup Language) is a versatile markup language designed for storing and transporting data in a structured, human-readable format. Its hierarchical nature makes it ideal for representing complex data structures, which can then be shared across different systems.

Using XML with FileMaker Pro 6 allows for:

- Data import/export in standardized formats
- Data interchange between FileMaker and other applications
- Facilitating data transformation and reporting workflows

Exporting Data from FileMaker Pro 6 as XML

To export data as XML:

- Open your FileMaker database and navigate to the layout containing the data you want to export.
- Choose **File > Save Records As > XML**.
- Specify the filename and location for the XML file.
- Define the XML schema if needed, or use default settings.
- Click **Save** to generate the XML file.

Tip: You can create custom XML schemas to organize your data more precisely.

Transforming XML Data Using XSLT

Introduction to XSL and XSLT

XSL (eXtensible Stylesheet Language) is a family of recommendations for defining XML document presentation. XSLT (XSL Transformations) is a language for transforming XML documents into other XML documents, HTML, or text.

In FileMaker Pro 6, you can utilize external tools or scripting to apply XSLT transformations to your XML data, enabling:

- Customized report generation
- Data reformatting for specific applications
- Seamless integration with web services or other systems

Applying XSLT to XML Data

Since FileMaker Pro 6 does not natively support XSLT processing, developers typically:

- Export data as XML from FileMaker
- Use external command-line tools or scripts (like xsltproc or MSXML) to transform the XML using an XSL stylesheet
- Import the transformed data back into FileMaker or export it for other uses

Example Workflow:

- Create an XSL stylesheet to define how XML data should be transformed.
- Automate the transformation process via scripts or third-party tools.
- Import or utilize the transformed data as needed.

Tip: Automate the entire process with FileMaker scripts that invoke external tools using the "Perform AppleScript" or "Perform Shell Script" steps.

Generating Word Documents from FileMaker Data

Why Generate Word Documents?

Automatically creating Word documents from your database data can streamline reporting, client communication, and documentation tasks, saving time and reducing errors.

Methods to Create Word Documents

Since FileMaker Pro 6 does not have native support for Word document creation, developers can use several approaches:

- Export data as Rich Text Format (RTF) or HTML, then open in Word and save as DOC/DOCX
- Use scripting to generate Word-compatible XML or HTML files that Word can interpret
- Leverage external automation tools like AppleScript (on Mac) or COM automation (on Windows) to control Word directly

Using RTF for Word Document Generation

RTF is a document file format supported by Word that can be generated programmatically:

- Design an RTF template with placeholders for data
- Use FileMaker scripts to replace placeholders with actual data
- Export the resulting RTF file and open it in Word for final editing or distribution

Example steps:

- Create an RTF template with merge fields.
- Populate fields via FileMaker scripts.
- Export as RTF and open in Word for formatting and final touches.

Tip: Automate this process with AppleScript or Windows Script Host for seamless document creation.

Integrating FileMaker Pro 6 with Word and Other Office Applications

Automating Word with FileMaker

On Windows, COM (Component Object Model) automation allows FileMaker to control Word directly:

- Open Word application object
- Create new documents or modify existing templates
- Insert data into specific bookmarks or placeholders
- Save and close documents programmatically

Sample Workflow:

- Use FileMaker's "Perform AppleScript" (on Mac) or "Perform JavaScript" / "Perform Windows Script" (on Windows) steps.
- Write scripts to automate Word actions, such as inserting data, applying styles, and saving documents.

Benefits of Office Automation

- Reduces manual data entry errors
- Accelerates report generation
- Ensures consistency across documents

Best Practices and Tips for Developers

- Always validate your XML data with schemas to ensure correctness before transformation.
- Maintain clear separation between data, transformation stylesheets, and presentation templates.
- Test external scripts and automation thoroughly to prevent errors during batch processing.
- Keep your workflows modular, allowing easy updates to stylesheets or templates without affecting core data processes.
- Leverage existing tools and libraries for XML and Word automation to streamline development.

Security Considerations

- Be cautious when executing external scripts or automation to prevent security vulnerabilities.
- Validate all data inputs to prevent injection attacks or corrupt files.
- Use secure file handling practices, especially when dealing with sensitive data.

Conclusion

Integrating FileMaker Pro 6 with XML, XSL, and Word unlocks a wide array of capabilities for data management, transformation, and reporting. While FileMaker's built-in features provide a solid
