Understanding Logarithms: A Brief Overview

Before diving into word problems, let's briefly review what logarithms are:

- Definition: The logarithm of a number is the exponent to which a fixed base must be raised to produce that number.

For example, $\log_b x = y$ means $b^y = x$.

- Common Bases:

- Base 10 (Common logarithm): $\log_{10}$

- Base e (Natural logarithm): $\ln$

- Properties:

- $\log_b(xy) = \log_b x + \log_b y$

- $\log_b\left(\frac{x}{y}\right) = \log_b x - \log_b y$

- $\log_b x^k = k \log_b x$

- Change of base formula: $\log_b x = \frac{\log_k x}{\log_k b}$

Understanding these fundamentals will help you solve any logarithm word problem with confidence.

Logarithm Word Problems Examples with Step-by-Step Solutions

Let's explore detailed examples to illustrate how to approach and solve real-world problems involving logarithms.

Example 1: Population Growth

Problem: The population of a town was 20,000 in 2010. It has been growing at an annual rate of 4%. What will the population be in 2025?

Solution:

Step 1: Identify the variables:

- Initial population, $(P_0 = 20,000)$
- Growth rate, $(r = 4\% = 0.04)$
- Number of years, $(t = 2025 - 2010 = 15)$

Step 2: Write the exponential growth formula:

$$P(t) = P_0 \times (1 + r)^t$$

$$P(t) = P_0 \times (1 + r)^t$$

$$P(15) = 20,000 \times (1 + 0.04)^{15}$$

$$P(15) = 20,000 \times (1.04)^{15}$$

$$P(15) = 20,000 \times (1.04)^{15}$$

$$P(15) = 20,000 \times (1.04)^{15}$$

Step 3: Calculate:

$$P(15) = 20,000 \times (1.04)^{15}$$

$$P(15) = 20,000 \times (1.04)^{15}$$

$$30,000 = 20,000 \times (1.04)^t$$

Step 4: Use logarithms to find the growth factor if the rate is unknown, or to verify growth:

Suppose we want to find how long it takes for the population to reach 30,000, given the growth rate.

$$30,000 = 20,000 \times (1.04)^t$$

$$30,000 = 20,000 \times (1.04)^t$$

\]

Divide both sides by 20,000:

\[

$$1.5 = (1.04)^t$$

\]

Take the natural logarithm:

\[

$$\ln 1.5 = \ln (1.04)^t = t \times \ln 1.04$$

\]

Solve for t :

\[

$$t = \frac{\ln 1.5}{\ln 1.04}$$

\]

Calculate:

\[

$$t = \frac{0.4055}{0.0392} \approx 10.34$$

\]

Answer: It will take approximately 10.34 years for the population to reach 30,000.

Example 2: Radioactive Decay

Problem: A certain radioactive substance has a half-life of 8 hours. How long will it take for a sample of 100 grams to decay to 25 grams?

Solution:

Step 1: Recognize this is exponential decay:

\[

$$A(t) = A_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

\]

where $(A_0 = 100)$, $(A(t) = 25)$, $(T_{1/2} = 8)$ hours.

Step 2: Set up the equation:

\[

$$25 = 100 \times \left(\frac{1}{2}\right)^{t / 8}$$

\]

Divide both sides by 100:

\[

$$0.25 = \left(\frac{1}{2}\right)^{t / 8}$$

\]

Step 3: Take natural logarithms:

\[

$$\ln 0.25 = \ln \left(\left(\frac{1}{2}\right)^{t/8}\right) = \frac{t}{8} \times \ln \frac{1}{2}$$

\]

Step 4: Solve for (t) :

\[

$$t = 8 \times \frac{\ln 0.25}{\ln \frac{1}{2}}$$

\\

Calculate:

\\

$$\ln 0.25 = -1.3863$$

\\

\\

$$\ln \frac{1}{2} = -0.6931$$

\\

So:

\\

$$t = 8 \times \frac{-1.3863}{-0.6931} = 8 \times 2 = 16$$

\\

Answer: It will take 16 hours for the sample to decay to 25 grams.

Example 3: pH Calculation

Problem: A solution has an acidity level with a hydrogen ion concentration of (2.5×10^{-5}) mol/L. What is its pH?

Solution:

Step 1: Recall the pH formula:

\\

$$\text{pH} = -\log_{10} [\text{H}^+]$$

\\

Step 2: Substitute the given value:

[

$$\text{pH} = -\log_{10} (2.5 \times 10^{-5})$$

]

Step 3: Use logarithm properties:

[

$$\text{pH} = - [\log_{10} 2.5 + \log_{10} 10^{-5}] = - [\log_{10} 2.5 - 5]$$

]

Calculate $(\log_{10} 2.5)$:

[

$$\log_{10} 2.5 \approx 0.3979$$

]

So:

[

$$\text{pH} = - (0.3979 - 5) = -0.3979 + 5 = 4.6021$$

]

Answer: The pH of the solution is approximately 4.60.

Example 4: Compound Interest and Investment

Problem: An investment of \$5,000 grows at an annual interest rate of 6%. How long will it take for the investment to grow to \$10,000?

Solution:

Step 1: Use the compound interest formula:

\[

$$A = P \times (1 + r)^t$$

\]

where:

- \[$A = 10,000$ \]

- \[$P = 5,000$ \]

- \[$r = 0.06$ \]

Step 2: Set up the equation:

\[

$$10,000 = 5,000 \times (1.06)^t$$

\]

Divide both sides by 5,000:

\[

$$2 = (1.06)^t$$

\]

Step 3: Take the natural logarithm:

\[

$$\ln 2 = t \times \ln 1.06$$

\]

Calculate:

$\ln$
 $\ln 2 \approx 0.6931$
 $\ln$
 $\ln$
 $\ln 1.06 \approx 0.0583$

These problems serve as an essential bridge between theoretical mathematics and real-world scenarios, offering learners and professionals alike a means to contextualize and deepen their understanding of logarithmic concepts. This comprehensive review aims to dissect the nature of logarithm word problems, analyze illustrative examples, and explore strategies for effective problem-solving.

The Significance of Logarithm Word Problems in Mathematical Education and Application

Logarithm word problems are more than mere exercises; they are vital pedagogical tools that foster critical thinking, analytical skills, and the ability to interpret mathematical language within contextual frameworks. For students, mastering these problems enhances comprehension of key properties of logarithms—such as the product, quotient, and power rules—and develops their capacity to translate verbal descriptions into algebraic expressions.

In professional contexts, logarithm problems underpin models in fields like acoustics (decibels), population dynamics (growth and decay), chemistry (pH calculations), finance (compound interest), and computer science (algorithm complexity). Therefore, proficiency in solving logarithm word problems translates into improved decision-making and problem-solving capabilities across disciplines.

Fundamental Components of Logarithm Word Problems

Before delving into specific examples, it is crucial to understand the typical structure and elements involved in logarithm word problems:

- Contextual Narrative: The real-world scenario or application setting.
- Quantities and Variables: Known and unknown quantities representing the problem's parameters.
- Relationships and Conditions: Descriptions of how quantities relate, often involving exponential or logarithmic relationships.
- Question or Objective: The specific quantity or value to be determined.

Effective problem-solving begins with translating the narrative into a mathematical model, often involving logarithmic or exponential equations.

Common Types of Logarithm Word Problems and Their Examples

This section explores typical categories of logarithm word problems, supported by illustrative examples and detailed solutions.

1. Decibel and Sound Intensity Problems

Scenario: The loudness of sound is measured in decibels (dB), related to the intensity (I) of the sound by the formula:

$$L \text{ (dB)} = 10 \log_{10} \left(\frac{I}{I_0} \right),$$

where I_0 is a reference intensity.

Example Problem:

A sound has an intensity of $1 \times 10^{-8} \text{ W/m}^2$, and it is measured to be 60 dB. What is the reference intensity I_0 ?

Solution Approach:

- Recognize the relationship: $L = 10 \log_{10} \left(\frac{I}{I_0} \right)$.
- Rearrange to solve for I_0 :

$$I_0 = I \times 10^{-\frac{dB}{10}}.$$

- Plug in known values:

$$I_0 = 1 \times 10^{-8} \times 10^{-\frac{60}{10}} = 1 \times 10^{-8} \times 10^{-6} = 1 \times 10^{-14}$$

$$10^{-14} \text{ W/m}^2.$$

Insights:

This problem exemplifies how logarithmic equations model perceptual scales and demonstrate the exponential nature of sound intensity.

2. Radioactive Decay and Half-Life Problems

Scenario: The decay of radioactive material follows the exponential model:

$$N(t) = N_0 e^{-\lambda t},$$

where $N(t)$ is the quantity remaining after time t , N_0 is the initial quantity, and λ is the decay constant.

Example Problem:

A sample of a radioactive isotope has a half-life of 12 hours. How long will it take for the sample to decay to 25% of its original amount?

Solution Approach:

- Recognize that the half-life $T_{1/2}$ relates to λ :

$$T_{1/2} = \frac{\ln 2}{\lambda}.$$

- Find λ :

$$\lambda = \frac{\ln 2}{12}.$$

- Determine the time t when $N(t) = 0.25 N_0$:

$$0.25 N_0 = N_0 e^{-\lambda t} \rightarrow 0.25 = e^{-\lambda t}.$$

- Take natural logarithm:

$$\ln 0.25 = -\lambda t \rightarrow t = -\frac{\ln 0.25}{\lambda}.$$

- Substitute λ :

$$t = -\frac{\ln 0.25}{\frac{\ln 2}{12}} = -\frac{\ln 0.25}{\ln 2} \times 12.$$

- Calculate:

$$\ln 0.25 = \ln \left(\frac{1}{4} \right) = -\ln 4 = -1.386.$$

$$\ln 2 = 0.693.$$

$$t = -\frac{-1.386}{0.693} \times 12 = 2 \times 12 = 24 \text{ hours}.$$

Insights:

This example highlights the use of logarithms in modeling exponential decay and the concept of half-life.

3. Population Growth and Decay Models

Scenario: Population $P(t)$ grows exponentially:

$$P(t) = P_0 e^{rt},$$

where r is the growth rate.

Example Problem:

A city's population was 1 million in 2010. If it grew to 1.2 million by 2015, assuming continuous growth, what is the annual growth rate r ?

Solution Approach:

- Set known values:

$$1.2 \times 10^6 = 1 \times 10^6 \times e^{5r}.$$

- Simplify:

$$1.2 = e^{5r}$$

- Take natural logarithm:

$$\ln 1.2 = 5r \rightarrow r = \frac{\ln 1.2}{5}$$

- Calculate:

$$\ln 1.2 \approx 0.182$$

$$r \approx \frac{0.182}{5} = 0.0364$$

- Convert to percentage:

$$r \approx 3.64\% \text{ per year}$$

Insights:

This problem illustrates how logarithms enable the calculation of growth rates from real data.

4. pH and Logarithmic Concentration Problems

Scenario: The pH of a solution relates to hydrogen ion concentration:

$$\text{pH} = -\log_{10} [\text{H}^+]$$

Example Problem:

A solution has a pH of 3.5. What is the concentration of hydrogen ions $[\text{H}^+]$?

Solution Approach:

- Rearrange:

$$[\text{H}^+] = 10^{-\text{pH}}$$

- Calculate:

$$[H^+] = 10^{-3.5} \approx 3.16 \times 10^{-4} \text{ mol/L.}$$

Insights:

This type of problem demonstrates the application of logarithms in chemistry for quantifying acidity.

Question What is a common example of a logarithm word problem involving compound interest? A typical problem asks: If an investment grows to \$10,000 in 5 years at an annual interest rate of 5%, how long will it take to double the investment? You can use the logarithm form of the compound interest formula to solve for time. How do you solve a problem where you need to find the exponent in an exponential equation using logarithms? You rewrite the exponential equation in logarithmic form. For example, if $2^x = 16$, then $x = \log_2(16)$, which equals 4. This helps find the exponent directly. Can you give an example of a word problem involving pH levels and logarithms? Yes. The pH of a solution is calculated as $\text{pH} = -\log[\text{H}^+]$. If the hydrogen ion concentration $[\text{H}^+]$ is 1×10^{-4} M, then the pH is $-\log(1 \times 10^{-4}) = 4$. How do logarithms help in solving problems involving scales like Richter or decibel scales? Both scales are logarithmic. For example, the Richter scale measures earthquake magnitude. If an earthquake has a magnitude of 6, and another has a magnitude of 4, the difference corresponds to a $10^{(6-4)} = 100$ -fold increase in amplitude, which can be calculated using logarithms. What is an example of a real-world problem involving exponential decay and logarithms? Suppose a radioactive substance has a half-life of 3 hours. How much remains after 9 hours? Using exponential decay, you can set up the equation and use logarithms to find the remaining percentage. How can logarithms be used to solve problems involving sound intensity levels? Sound intensity levels in decibels (dB) are calculated using the formula $\text{dB} = 10 \log_{10}(I / I_0)$, where I is the intensity. If the intensity doubles, the dB level increases by about 3 dB, which can be found using logarithms. Can you provide an example of a word problem involving exponential growth and logarithms? Yes. If a population of bacteria doubles every 3 hours and starts with 100 bacteria, how long until the population reaches 800? Using the exponential growth formula and logarithms, you can find the time needed. How do you approach solving logarithmic word problems involving transformations or shifts? Identify the exponential or logarithmic relationship, rewrite it in log form if needed, and then solve for the variable of interest. For example, solving for time or rate in growth or decay processes often involves taking logarithms to linearize the problem. What are some tips for translating word problems into logarithmic equations? Read carefully to identify exponential relationships, such as growth or decay. Write the relevant formula, then take the logarithm of both sides to solve for the unknown exponent or variable. Practice recognizing patterns like doubling, halving, or exponential increase/decrease.
