Introduction to Chemical Reactions

Definition of a Chemical Reaction

A chemical reaction is a process in which one or more substances, known as reactants, undergo a chemical change to form new substances called products. These reactions involve rearrangement of atoms and the breaking and forming of chemical bonds.

Characteristics of Chemical Reactions

Chemical reactions are identified by several key features:

- Change in color, odor, or temperature

- Evolution or absorption of energy
- New substances with different properties from the reactants

Types of Chemical Reactions

Chemical reactions can be classified into various types based on the nature of reactants and products. The main types include:

1. Combination (Synthesis) Reactions

In these reactions, two or more substances combine to form a single compound.

- General formula: $A + B \rightarrow AB$
- Example: $2H_2 + O_2 \rightarrow 2H_2O$

2. Decomposition Reactions

A single compound breaks down into two or more simpler substances.

5. Redox (Oxidation-Reduction) Reactions

Reactions involving transfer of electrons between substances, involving oxidation and reduction processes.

Balancing Chemical Equations

Importance of Balancing Equations

Balancing ensures the law of conservation of mass is obeyed, meaning the number of atoms of

each element remains the same on both sides of the equation.

Steps to Balance Chemical Equations

- Write the unbalanced equation with correct formulas.
- Count the number of atoms of each element on both sides.
- Use coefficients to balance atoms for each element.
- Repeat until the equation is balanced.

Example of Balancing

Unbalanced: $\text{H}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O}$

Balanced: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$

Factors Affecting Chemical Reactions

Various factors influence the rate and extent of chemical reactions:

1. Concentration

Higher concentration of reactants increases the rate of reaction.

2. Temperature

Elevated temperatures provide more energy, increasing reaction rates.

3. Surface Area

Smaller particle size increases surface area, enhancing reaction speed.

4. Catalysts

Substances that increase reaction rate without being consumed in the process.

5. Pressure

Particularly relevant for reactions involving gases; increased pressure favors reactions with fewer gas molecules.

Energy Changes in Chemical Reactions

Exothermic and Endothermic Reactions

- Exothermic reactions release energy, usually as heat or light (e.g., combustion).
- Endothermic reactions absorb energy from surroundings (e.g., photosynthesis).

Activation Energy

The minimum energy needed for a reaction to occur. Catalysts work by lowering activation energy.

Chemical Equations and Their Significance

Understanding Chemical Equations

Chemical equations provide a symbolic representation of chemical reactions, showing the reactants, products, and their relative quantities.
