Sample Question and Answer from a Diploma Electronics Communication Paper

Question:

Explain the principle of amplitude modulation (AM) and derive the expression for an AM wave.

Answer:

Amplitude modulation (AM) is a modulation technique where the amplitude of a high-frequency carrier wave is varied in proportion to the instantaneous amplitude of the message signal (modulating signal). This method enables the transmission of audio, video, or data signals over communication channels.

Principle of AM:

- The message signal ($m(t)$) contains the information to be transmitted.
- A high-frequency carrier wave ($c(t)$) is modulated by $m(t)$.
- The resulting AM wave contains the carrier frequency along with sidebands that carry the information.

Mathematical Expression:

Let the message signal be $m(t)$, and the carrier wave be:

$$c(t) = A_c \cos(\omega_c t)$$

where:

- A_c = amplitude of the carrier
- ω_c = angular frequency of the carrier

The modulated wave (AM wave) is given by:

$$s(t) = [A_c + m(t)] \cos(\omega_c t)$$

Assuming:

$$m(t) = A_m \cos(\omega_m t)$$

where:

- A_m = amplitude of message signal
- ω_m = angular frequency of message signal

Then:

$$s(t) = [A_c + A_m \cos(\omega_m t)] \cos(\omega_c t)$$

Using the trigonometric identity:

$$\cos A \cos B = \frac{1}{2} [\cos(A + B) + \cos(A - B)]$$

Expanding, we get:

$$s(t) = A_c \cos(\omega_c t) + A_m \cos(\omega_m t) \cos(\omega_c t)$$

$$= A_c \cos(\omega_c t) + \frac{A_m}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$

Final Expression:

[

$$s(t) = A_c \cos(\omega_c t) + \frac{A_m}{2} \cos(\omega_c + \omega_m)t + \frac{A_m}{2} \cos(\omega_c - \omega_m)t$$

]

This expression shows the carrier frequency component and the two sidebands which contain the information. The process of demodulation involves extracting the message signal from this AM wave.

Conclusion

A well-structured diploma electronics communication question paper with answers is an invaluable tool for students aiming to excel in their exams. By understanding the exam pattern, practicing previous question papers, and thoroughly reviewing answers, students can build confidence and improve their problem-solving skills. Understanding the Structure of Diploma Electronics Communication Question Papers

A typical diploma electronics communication question paper is carefully structured to evaluate various facets of the subject. It generally comprises sections that test theoretical knowledge, problem-solving skills, and practical understanding.

Sections Breakdown

- Multiple Choice Questions (MCQs): These test basic concepts and quick recall.
- Short Answer Questions: Focus on definitions, explanations, and fundamental principles.
- Descriptive / Long Answer Questions: Require detailed explanations, derivations, and comprehensive solutions.
- Numerical Problems: Assess practical application skills through calculation-based questions.

Features of Well-Designed Question Papers

- Coverage of all core topics such as modulation techniques, transmission media, and digital communication.
- Inclusion of recent advances and applications to keep students updated.
- Balanced difficulty level across questions to differentiate student understanding.

Key Topics Covered in Diploma Electronics Communication Question Papers

A typical question paper encompasses a broad spectrum of topics vital for understanding electronics communication systems.

1. Analog Modulation Techniques

Understanding modulation is fundamental in communication systems. Questions often cover:

- Amplitude Modulation (AM)
- Frequency Modulation (FM)
- Phase Modulation (PM)

Sample Question & Answer:

Q: Explain the principle of amplitude modulation and derive the expression for the modulated wave.

Answer:

Amplitude modulation involves varying the amplitude of the carrier wave in proportion to the message signal. If the message signal is $m(t)$ and the carrier wave is $c(t) = A_c \cos(2\pi f_c t)$, then the modulated wave $s(t)$ can be expressed as:

[

$$s(t) = [A_c + m(t)] \cos(2\pi f_c t)$$

]

For a message signal $m(t) = A_m \cos(2\pi f_m t)$, the modulated wave becomes:

\[

$$s(t) = A_c \cos(2\pi f_c t) + A_m \cos(2\pi f_m t) \cos(2\pi f_c t)$$

\]

Using the trigonometric identity:

\[

$$\cos A \cos B = \frac{1}{2} [\cos(A + B) + \cos(A - B)]$$

\]

we get:

\[

$$s(t) = A_c \cos(2\pi f_c t) + \frac{A_m}{2} [\cos 2\pi (f_c + f_m) t + \cos 2\pi (f_c - f_m) t]$$

\]

This reveals that the spectrum contains a carrier and two sidebands, crucial for demodulation.

2. Digital Communication Techniques

Questions often explore:

- Pulse Code Modulation (PCM)
- Differential Pulse Code Modulation (DPCM)
- Frequency Shift Keying (FSK)
- Phase Shift Keying (PSK)
- Quadrature Amplitude Modulation (QAM)

Sample Question & Answer:

Q: Differentiate between ASK, FSK, and PSK modulation techniques.

Answer:

| Aspect | Amplitude Shift Keying (ASK) | Frequency Shift Keying (FSK) | Phase Shift Keying (PSK) |

|-----|-----|-----|-----|
 -----|

| Definition | Variations in amplitude to represent data | Variations in frequency to encode information
 | Variations in phase of the carrier signal |

| Complexity | Simple to implement | Moderate complexity | More complex, requires phase
 synchronization |

| Noise Immunity | Less resistant to noise | Better than ASK | High resistance to noise |

| Power Efficiency | Less efficient | More efficient | Most efficient among the three |

| Application Examples | Low-speed data communication | Radio transmission systems | Satellite
 communication, modems |
