Key Components of a PLC System

1. Central Processing Unit (CPU)

The CPU is the brain of the PLC, executing control instructions stored in memory. It processes input signals, runs the control logic, and sends commands to outputs.

2. Input Modules

These modules receive signals from various sensors and input devices, such as switches, temperature sensors, or proximity detectors.

3. Output Modules

Output modules send control signals to actuators like motors, valves, or indicator lights based on the logic processed by the CPU.

4. Power Supply

Provides the necessary electrical power for the PLC and its modules to operate reliably.

5. Communication Interface

Facilitates data exchange between the PLC and other devices or networks, including Ethernet, Profibus, or Modbus.

6. Programming Device

Typically a computer or handheld programmer used to write, test, and upload control programs to the PLC.

Understanding PLC Programming Languages
